## INTRODUCTION

---

This report provides a detailed explanation of the development of the number guessing program using Test Driven Development. The main intention of this program is to generate a score based on the number of times it takes the user to guess the randomly generated four-digit number. The program will then give some clues about the number. Once the player guesses the number correctly, the program will show the number of attempts taken.

The requirements of the program are:

- Randomly generate a four-digit number.
- The program will keep asking the user to guess the number until the player guesses it correctly or has quit.
- When the number is entered, the program will respond with hints using 'circle' and 'x' to show how accurate the guess was.
  - A 'circle' indicates that one digit is correct and is in the right spot.
  - A 'x' indicates that one digit is correct but in the wrong spot.
- Once the game is finished,
  - The number of attempts taken will be displayed.
  - The player will be asked to quit or to play again.
- Players can quit the game anytime.

## PROGRAMMING LANGUAGE AND UNIT TESTING TOOL

---

Python is a potent programming language that's simple to comprehend and easy on the eyes. It showcases many traits shared by numerous other languages and proves its practicality in real-life scenarios. Moreover, it is freely available, comes with a standardized version, and enjoys the support of a sizable and affable community of passionate developers.

**PyUnit (unittest):** The foundation of the unittest unit testing framework drew its initial inspiration from JUnit and carried a comparable essence to prominent testing frameworks in various programming languages. It enables automated testing, sharing setup and teardown code for tests, grouping tests into collections, and ensuring that tests remain unaffected by the reporting system used (Python, 2023). The fact that this is a built-in module of python makes it more dependable.

## PROCESS

---

Test-driven development (TDD) represents an agile approach to software development. Like other agile methodologies, TDD constructs software in incremental steps, commencing with creating an automated test, succeeded by a small segment of code tailored to fulfill that test's requirements. Subsequently, the code is refined to enhance its performance (Anwer et al., 2017). TDD starkly contrasts conventional software development practices that follow a sequence of design, coding, and testing. Instead, TDD inverts this sequence, initiating testing before coding even begins. The primary aim of TDD is to curtail the occurrence of defects and elevate the overall quality of code.

The phases of the number guessing program are as follows:

1. Test Cases and Initial Failing Test
2. Development to Pass the Test
3. Passing the Test

Unlike in other development approaches, in TDD the tests for any unit function are written first before the development of the business logic itself. Similarly, the test cases for the functionality of the number guessing game were written first and was expected to fail first.

---

## 1. RANDOM NUMBER GENERATION FUNCTION

---

The random number generation function is responsible for generating the random four-digit number that the player must guess.

```
import unittest
from unittest.mock import patch
from guess_number_game import guess_number_game

class TestGuessNumberGame(unittest.TestCase):
    def setUp(self):
        self.game = guess_number_game(1234)

    def test_generate_random_number_randomness(self):
        random_number1 = self.game.generate_random_number()
        random_number2 = self.game.generate_random_number()
        random_number3 = self.game.generate_random_number()
        random_number4 = self.game.generate_random_number()
        self.assertNotEqual(random_number1, random_number2)
        self.assertNotEqual(random_number1, random_number3)
        self.assertNotEqual(random_number1, random_number4)

    def test_generate_random_number_data_type(self):
        random_number = self.game.generate_random_number()
        result = isinstance(random_number, int)
        self.assertTrue(result)
        result = isinstance(random_number, float)
        self.assertFalse(result)
        result = isinstance(random_number, str)
        self.assertFalse(result)
```

FIGURE 1: TEST CASES FOR RANDOM NUMBER GENERATION

FIGURE 2: FAILED TEST FOR RANDOM NUMBER GENERATION

```

# Generate a random four-digit number
def generate_random_number(self):
    digits = [0, 1, 2, 3, 4, 5, 6, 7, 8, 9]
    # Shuffle the digits
    random.shuffle(digits)
    # Take the first 4 digits
    generated_value = int(''.join(map(str, digits[:4])))
    return generated_value

```

FIGURE 3: FUNCTION DEVELOPMENT OF RANDOM NUMBER GENERATION

The screenshot shows a code editor with a file explorer on the left and a terminal at the bottom. The file explorer shows a project structure with files like `guess_number_game.py`, `test_generate_random_number.py`, `main.py`, `README.md`, and `rules.md`. The code editor displays the content of `test_generate_random_number.py`, which includes imports for `unittest` and `unittest.mock`, and a class `TestGuessNumberGame` with two test methods: `test_generate_random_number_randomness` and `test_generate_random_number_data_type`. The terminal shows the output of running the tests, indicating that all tests passed successfully.

```
test_generate_random_number.py
import unittest
from unittest.mock import patch
from guess_number_game import guess_number_game

class TestGuessNumberGame(unittest.TestCase):
    def setUp(self):
        self.game = guess_number_game(1234)

    def test_generate_random_number_randomness(self):
        random_number1 = self.game.generate_random_number()
        random_number2 = self.game.generate_random_number()
        random_number3 = self.game.generate_random_number()
        random_number4 = self.game.generate_random_number()
        self.assertEqual(random_number1, random_number2)
        self.assertNotEqual(random_number1, random_number3)
        self.assertNotEqual(random_number1, random_number4)

    def test_generate_random_number_data_type(self):

FIGURE 4: PASSED TEST FOR RANDOM NUMBER GENERATION

## 2. GET HINT FUNCTION

This function is responsible for hint generation for the input number using circles and crosses.

```
import unittest
from unittest.mock import patch
from guess_number_game import guess_number_game

class TestGuessNumberGame(unittest.TestCase):
    def setUp(self):
        self.game = guess_number_game(1234)

    def test_get_hint_different_numbers(self):
        str_num1 = "1234"
        str_num2 = "9876"
        result = self.game.get_hint(str_num1, str_num2)
        compare_data = {
            'O': "",
            'X': ""
        }
        self.assertEqual(result, compare_data)

    def test_get_hint_different_places(self):
        str_num1 = "1234"
        str_num2 = "4871"
        result = self.game.get_hint(str_num1, str_num2)
        compare_data = {
            'O': "",
            'X': "XX"
        }
        self.assertEqual(result, compare_data)

    def test_get_hint_some_correct(self):
        str_num1 = "1234"
        str_num2 = "1874"
        result = self.game.get_hint(str_num1, str_num2)
        compare_data = {
            'O': "00",
            'X': ""
        }
        self.assertEqual(result, compare_data)

    def test_get_hint_some_correct_some_different(self):
        str_num1 = "1234"
        str_num2 = "1324"
        result = self.game.get_hint(str_num1, str_num2)
        compare_data = {
            'O': "00",
            'X': "XX"
        }
        self.assertEqual(result, compare_data)
```

### 3. NUMBER COMPARISON FUNCTION

This function is responsible for comparing the randomly generated four-digit number and the input number by the user.

```
import unittest
from unittest.mock import patch
from guess_number_game import guess_number_game

class TestGuessNumberGame(unittest.TestCase):
    def setUp(self):
        self.game = guess_number_game(1234)

    def test_compare_guess_correct(self):
        self.assertTrue(self.game.compare_guess(1234))

    def test_compare_guess_incorrect(self):
        self.assertFalse(self.game.compare_guess(5678))

    def test_compare_guess_input_exception(self):
        with self.assertRaises(ValueError) as exception_context:
            self.game.compare_guess(guess_number="1234")
        self.assertEqual(
            str(exception_context.exception),
            "Both inputs must be integers"
        )

    def test_compare_guess_generated_number_exception(self):
        self.game.generated_number = "1234"
        with self.assertRaises(ValueError) as exception_context:
            self.game.compare_guess(guess_number=1234)
        self.assertEqual(
            str(exception_context.exception),
            "Both inputs must be integers"
        )

    def test_compare_guess_input_value_range_exception(self):
        with self.assertRaises(ValueError) as exception_context:
            self.game.compare_guess(guess_number=12345)
        self.assertEqual(
            str(exception_context.exception),
            "Both numbers must be 4-digit numbers"
        )

    def test_compare_guess_generated_number_value_range_exception(self):
        self.game.generated_number = 12345
        with self.assertRaises(ValueError) as exception_context:
            self.game.compare_guess(guess_number=1234)
        self.assertEqual(
            str(exception_context.exception),
            "Both numbers must be 4-digit numbers"

FIGURE 11: FUNCTION DEVELOPMENT OF NUMBER COMPARISON FUNCTION

The screenshot shows a code editor with a file explorer on the left and a terminal at the bottom. The file explorer shows a project structure with files like `guess_number_game.py`, `test_compare_guess.py`, `main.py`, `README.md`, and `rules.md`. The `test_compare_guess.py` file is open in the editor, showing a test class `TestGuessNumberGame` with several test methods. The terminal shows the output of running the tests, including failure messages and a final summary of 6 tests passing.

## OUTCOME OF THE PROGRAM

```

D:\Masters\Semester 1\...

RULES

1 A random number will be generated at the start of the game.
2 The main theme of the game is to guess the randomly generated number.
3 When the number is entered, the program will respond with hints using "O" and "X" to show how accurate the guess was

• A 'O' indicates that one digit is correct and is in the right spot.
• A 'X' indicates that one digit is correct but in the wrong spot.
• The number of such symbol represents the number of digits corresponding to the symbol.

You can Enter 'q' or 'Q' any time to quit the game.
Please Enter to Start the Game.

Input your guessed number : 1234
HISTORY

| Guesses | Crosses | Circles |
|---------|---------|---------|
| 1234    | XX      |         |

Input your guessed number : 1134
HISTORY

| Guesses | Crosses | Circles |
|---------|---------|---------|
| 1234    | XX      |         |
| 1134    | X       |         |

Input your guessed number : 2134
HISTORY

| Guesses | Crosses | Circles |
|---------|---------|---------|

```

FIGURE 18: EXECUTABLE PROGRAM OF THE GAME

## CONCLUSION

---

This report details how Test-Driven Development can be used to develop a Number Guessing Game. There were many requirements for the applications, such as random four-digit number generation, the input of user-guessed numbers until a correct number is guessed or the program is quit, using circles and crosses to show hints and the ability for the player to quit the game at any time. Overall, developing the program was relatively easy, but it was not easy as well. Python was used to create this program because it makes it easier to understand and maintain code, is fast, and, most importantly, comes pre-installed with the testing tools. In the beginning, it took time to write test cases and develop the application. Later, the familiarity of the tool increased, making it easier to implement. Most of the testing and debugging was done during the development phase, making the program less prone to bugs and issues. Therefore, this is the first time I have developed a program by writing tests first and then coding, and this assignment taught me a new way to do programming.
